

BUIDL CTC 2026 FALL · TRACK: RWA

Quita

On-chain credit life insurance with a loss ratio you can **verify** instead of believe.

Built on the Attestcoin Protocol · Ethereum Sepolia → Creditcoin CC3 Testnet

THE PROBLEM

An enormous market where nobody can check the numbers

R\$30B

Annual credit life premium in Brazil

~18%

Returned as claims

up to 87%

Captured as bank commission

Tying the policy to the loan has been litigated for years in Brazil. But the structural problem is simpler: **every one of these numbers is a disclosure.** The insurer states the loss ratio. Nobody outside the insurer can verify it.

Source: analysis of Tema 972 litigation and industry commentary. Pending cross-check against public SUSEP statistics. Presented as order of magnitude, not audited data.

The people most exposed have the least cover

~50%

of the Latin American workforce is informal

\$267B

regional protection gap

Non-bank credit — the lenders actually serving informal workers — has essentially no credit life layer underneath it.

Not because the risk is unattractive, but because there is no infrastructure a small lender can plug into without becoming an insurer.

THE SOLUTION

Same product. Auditable in real time.

Quita is infrastructure a lender puts underneath a credit life book. The insured balance, the reserves, the premium and the claims all become on-chain state that moves **only when something was cryptographically proved**.

```
// CapitalPool.sol – the entire commercial argument
function lossRatioWad() external view returns (uint256) {
    if (totalPremiumsCollected == 0) return 0;
    return totalClaimsPaid.wdiv(totalPremiumsCollected);
}
```

Both counters are moved by verified events. Neither can be asserted by an operator.

HOW IT WORKS

The loan lives on Ethereum. The cover lives on Creditcoin.

No oracle operator anywhere in that path. The worker can withhold or delay. It **cannot fabricate**.

THE SLIDE THAT MATTERS

Verified vs trusted

FACT	STATUS	MECHANISM
Loan exists, principal, repayments	VERIFIED	Merkle inclusion via 0xFD2
Outstanding balance	VERIFIED	Copied from the proved log
Premium collected, claims paid	VERIFIED	Counters moved only by proofs
Transaction succeeded	VERIFIED	receiptStatus == 1
Log came from our contract	VERIFIED	Emitter pinned, immutable
Payout amount	VERIFIED	min(sumInsured, verified outstanding)
The borrower actually died	TRUSTED	2-of-3 threshold + challenge window

Death is a fact about the world. No protocol can verify it. Anyone claiming to have oracle-ised mortality is describing a trusted attester with extra steps.

Four events verified. Three attacks closed.

VERIFIED EVENTS

LoanDisbursed	LoanMirror
RepaymentMade	LoanMirror
PremiumPaid	PolicyRegistry
DeathAttested	ClaimEngine

PremiumPaid is verified because it is the *denominator* of the loss ratio.

ATTACKS CLOSED

- **Reverted tx.** Inclusion $\neq$ success. Emit, revert, prove, collect — unless receiptStatus is checked.
- **Clone.** Event signatures are unowned. Pin the emitter or anyone mints claims.
- **Cross-chain confusion.** ASCBase never passes chainKey to the handler. We added a guarded entrypoint and made the inherited one inert.

Nine years of real loans. Zero risk layer.

9 yrs

Creditcoin recording real-world credit on-chain

\$100M+

in loans registered

2M+

borrowers reached via partners such as Aella

There is no insurance or risk layer on top of any of it. **Loan Flow on Creditcoin EVM** is on the roadmap — Quita is a non-trivial first consumer, and credit life is the single product every one of those lenders already needs.

Declared limitations & roadmap

WHAT WE ARE NOT CLAIMING

- Death attestation is **trusted**. Threshold and challenge window mitigate; they do not eliminate.
- The stablecoin is a **mock**.
- Mortality table is a **declared placeholder**, pending BR-EMS 2021 from SUSEP.
- We are **not the insurer**. Infrastructure, not a carrier.

ROADMAP

- Attestor bonds and slashing
- BR-EMS 2021 with SUSEP filing
- Batch verification (10 proofs / call)
- Writability: mark loans extinguished back on Ethereum, once it leaves audit
- Full ERC-4626 vault · disability cover · mainnet

A limitation you declare is worth more than the same limitation someone else finds.

THANK YOU

Quita

Credit life cover where the loss ratio is a computation, not a claim.
